

Musical chills

Effects of stimulus properties,
stylistic preference and familiarity

Pleasurable moments in music

- Behavioural, physiological & computational methods
- Chills
 - Considered as pleasurable
 - Widespread, memorable, observable
- Expectancy
 - Linked with emotional responses to music
 - Hanslick, Meyer, Huron, Juslin, etc.

Objectives

- Causal link between chills and musical content
 - Dynamics, texture, melody, harmony, rhythm, instrumentation
 - Correlational evidence
- Are some songs more likely to cause chills than others?
- Are chills experienced at specific moments for these songs?
- Y Predict occurrences based on objective musical properties
- N Indicator of individualised emotion responses to music

Objectives

- Hypothesised underlying factors
 - Songs should cause chills for others
 - Songs should be in a liked genre
 - Songs should be familiar
 - Passages should be pleasurable
- Can we identify songs/moments which are likely to cause chills?

Design considerations

- Ecological validity
 - Existing pieces of music
- Causality
 - Controlled, longitudinal design
- Demand characteristics
 - Subjective responses
 - Continuous, objective measures

Methods

Stimuli

Procedure

Online

80 x 15s excerpts

Familiarity and stylistic preference ratings

Set of 12 unfamiliar songs for each participant

Lab 1

12 songs

Self-reported **chills**, **pleasurable moments** and **liking**

Objective **piloerection**

Longitudinal

12 songs x 8 repetitions to increase **familiarity**

Self-reported **chills** and **liking**

Lab 2

Similar to Lab 1

Qualitative feedback on causes of chills

Methods

Results

- Chills and pleasurable moments more likely in preferred genres

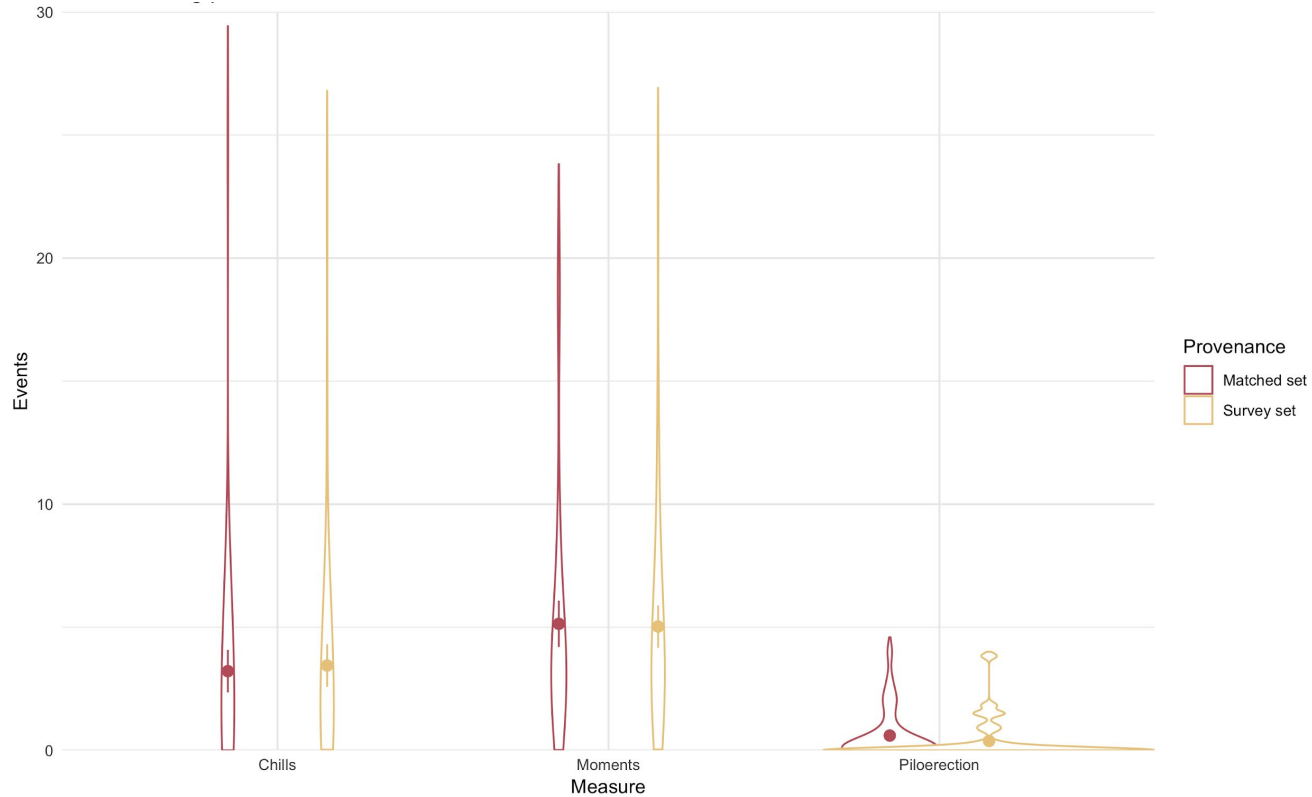

Results

- No effect of repetition

Results

- No effect of provenance

Results

- Provenance:Preference interaction for pleasurable moments

Results

- 42% of self-reported chills overlapped with pleasurable moments
- 29% of piloerection events overlapped with pleasurable moments
 - Both more likely than chance

Results

- 29% of piloerection events overlapped with self-reported chills
- 6% of self-reported chills overlapped with piloerection events
 - Both more likely than chance

Summary

- Association between chills and pleasurable moments
- Association between self-reported chills and piloerection
 - But observable piloerection remains rare
- Causal link between chills and stylistic preference
- Interaction between stylistic preference and stimulus-driven properties for pleasurable moments

Next steps

- More data cleaning!
- Further data analysis
 - Are time-stamps for chills consistent across participants?
 - Does familiarity increase the probability of experiencing pleasurable moments before chills?
- Predict when chills happen based on objective musical properties
 - Acoustic features, structural features
